

A

Same data, same contrasts, same null

254 contrasts, 75 studies. A weighted sum has no internal reference, so any broad perturbation moves it. Ranking each sample against its own transcriptome removes that. Global P < 0.0005 for all three rank-based sets; the multiplier above each bar is enrichment over the number expected by chance.

B

Agents lowering the stemness score

All 20 contrasts surviving FDR in this direction. BAY-1251152, a menin-MLL inhibitor, lowers the score in 7 cell lines; four carry KMT2A rearrangements. Eleven further contrasts survived in the opposite direction and are not shown.
